# 1 Example theory file for getting acquainted with Isabelle

## 1.1 Terms

We can write logical formulae and terms in the usual notation. Connectives such as  $\neg, \vee, \wedge$  etc. can be typed using the backslash `\` followed by the name of the sign. I.e. `\not` for  $\neg$ . Note that during typing `\not` at some point there will be a pop-up menu offering you certain auto completion suggestions that you can accept by pressing the tab key.

## 1.2 Types

All terms (and also constant symbols, variables etc.) are associated a type. The type *bool* is the type of all Boolean-values objects (e.g. truth values). New types can be inserted at will.

**typedecl** *i* — Create a new type *i* for the type of individuals

## 1.3 Constants

New constants can be defined using the *consts* keyword. You need to specify the type of the constant explicitly.

## 1.4 Terms and Formulas

In higher-order logic (HOL), terms are all well-formed expressions that can be expressed within the logic. A term has a unique type, such as in  $f A$  where the term  $f A$  has type *i*. Terms of type *bool* are called "formulas".

### 1.4.1 Example formula 1

If it's raining the street will get wet

**consts** *raining* :: *bool* — constant symbol for raining

**consts** *wet* :: *i*  $\Rightarrow$  *bool* — predicate symbol for wet

**consts** *street* :: *i* — constant symbol for the street

**prop** *raining*  $\longrightarrow$  *wet*(*street*) — raining implies street-is-wet

### 1.4.2 Example formula 2

**consts** *good* :: *i*  $\Rightarrow$  *bool* — predicate symbol for being good

**prop** *good*(*A*) — A is good

A is a free variable of the above term, hence it is not closed

### 1.4.3 Example formula 3

**prop**  $\forall A. \text{good}(A)$  — everything is good

A is a bound variable of the above term, which is universally qualified.

## 1.5 Proofs

We will learn how to formalize proofs in Isabelle throughout this course.

### 1.5.1 Proofs with handy keywords

**theorem** *MyFirstTheorem*:

**assumes** *A*

**shows**  $B \longrightarrow A$

**proof** —

{

**assume** *B*

**from** *assms* **have** *A* **by** — — Iterate the fact that A holds by assumptions using the - sign

}

**then have**  $B \longrightarrow A$  **by** (*rule impI*)

**thus** *?thesis* .

**qed**

### 1.5.2 Proofs with labels

**theorem** *MyFirstTheorem2*:

**assumes** *1*: *A*

**shows**  $B \longrightarrow A$

**proof** —

{

**assume** *B*

**from** *1* **have** *A* **by** —

} **note** *2 = this*

**from** *2* **have**  $B \longrightarrow A$  **by** (*rule impI*)

**thus** *?thesis* .

**qed**

### 1.5.3 Using the proofs

We can now derive simple facts of the above theorem.

**corollary** *ThatFollowsDirectly*:

**assumes** *A*

**shows**  $P(A) \longrightarrow A$

**using** *assms* **by** (*rule MyFirstTheorem*[**where**  $B = P(A)$ ])

**theorem** *excludedMiddle*:

**shows**  $A \vee \neg A$

```

proof -
{
  assume 1:  $\neg(A \vee \neg A)$ 
  {
    assume 2:  $\neg A$ 
    from 2 have 3:  $A \vee \neg A$  by (rule disjI2)
    from 1 have 4:  $\neg(A \vee \neg A)$  by -
    from 4 3 have False by (rule notE)
  }
  from this have 5:  $A$  by (rule ccontr)
  from 5 have 6:  $A \vee \neg A$  by (rule disjI1)
  from 1 6 have False by (rule notE)
}
from this have  $A \vee \neg A$  by (rule ccontr)
thus ?thesis .
qed

```

## 1.6 Exercise 1c: logical expressions natural language3

```

prop  $\exists \text{ ship. huge(ship) } \wedge \text{ blue(ship)}$ 
prop  $\neg \text{ shining}() \longrightarrow \text{ sad}(me)$ 
prop  $\text{ raining} \vee \text{ not-raining}$ 
prop  $\text{ going}(she) \longrightarrow \text{ going}(me) \wedge \neg \text{ going}(she) \longrightarrow \neg \text{ going}(me)$ 

```

## 2 Exercise 2

### 2.1 a)

```

theorem A:
  assumes 1:  $A \wedge B \longrightarrow C$ 
  assumes 2:  $B \longrightarrow A$ 
  assumes 3:  $B$ 
  shows  $C$ 
proof -
  from 2 3 have 4:  $A$  by (rule mp)
  from 4 3 have 5:  $A \wedge B$  by (rule conjI)
  from 1 5 have 6:  $C$  by (rule mp)
  thus ?thesis.
qed

```

### 2.2 b)

```

theorem B:
  assumes 1:  $A$ 
  shows  $B \longrightarrow A$ 
proof -
  {
    assume  $B$ 
    from 1 have  $A$  by -
  }

```

```

    } note 2 = this
    from 2 have 3:  $B \longrightarrow A$  by (rule impI)
    thus ?thesis.
qed

```

### 2.3 c)

```

theorem C:
  assumes 1:  $A \longrightarrow (B \longrightarrow C)$ 
  shows  $B \longrightarrow (A \longrightarrow C)$ 
proof -
  {
    assume 2: B
    {
      assume 3: A
      from 1 3 have 4:  $B \longrightarrow C$  by (rule mp)
      from 4 2 have 5: C by (rule mp)
    }
    from this have  $A \longrightarrow C$  by (rule impI)
  }
  from this have  $B \longrightarrow (A \longrightarrow C)$  by (rule impI)
  thus ?thesis.
qed

```

### 2.4 d)

```

theorem D:
  assumes 1:  $\neg A$ 
  shows  $A \longrightarrow B$ 
proof -
  {
    assume 2: A
    {
      assume 3:  $\neg B$ 
      from 1 have 4:  $\neg A$  by -
      from 2 have 5: A by -
      from 4 5 have False by (rule notE)
    }
    from this have  $\neg \neg B$  by (rule notI)
    from this have B by (rule notnotD)
  }
  from this have  $A \longrightarrow B$  by (rule impI)
  thus ?thesis.
qed

```

## 3 A Hilbert Proof Calculus for Propositional Logic (PL)

### 3.1 Logical Connectives for PL

#### 3.1.1 Primitive Connectives

**consts** *impl* :: *bool*  $\Rightarrow$  *bool*  $\Rightarrow$  *bool* (**infixr**  $\rightarrow$  49)

**consts** *not* :: *bool*  $\Rightarrow$  *bool* ( $\neg$ )

In philosophy, we often assume that the only two logical connectives are the implication *op*  $\rightarrow$  and the negation  $\neg$ . This is handy, since it simplifies proofs to only consider these two cases.

#### 3.1.2 Further Defined Connectives

We can of course add further connectives that are to be understood as abbreviations that are defined in terms of the primitive connectives above.

**abbreviation** *disj* :: *bool*  $\Rightarrow$  *bool*  $\Rightarrow$  *bool* (**infixr**  $\vee$  50) **where**

$A \vee B \equiv \neg A \rightarrow B$

**abbreviation** *conj* :: *bool*  $\Rightarrow$  *bool*  $\Rightarrow$  *bool* (**infixr**  $\wedge$  51) **where**

$A \wedge B \equiv \neg(A \rightarrow \neg B)$

### 3.2 Hilbert Axioms for PL

#### 3.2.1 Axiom Schemes

**axiomatization** **where**

*A2*:  $A \rightarrow (B \rightarrow A)$  **and**

*A3*:  $(A \rightarrow (B \rightarrow C)) \rightarrow ((A \rightarrow B) \rightarrow (A \rightarrow C))$  **and**

*A4*:  $(\neg A \rightarrow \neg B) \rightarrow (B \rightarrow A)$

#### 3.2.2 Inference Rules

**axiomatization** **where**

*ModusPonens*:  $(A \rightarrow B) \Longrightarrow A \Longrightarrow B$

**lemma** *True* **nitpick** [*satisfy*, *user-axioms*, *expect = genuine*] **oops**

### 3.3 A Proof

**thm** *A3*[**where**  $A = A$  **and**  $B = (B \rightarrow A)$  **and**  $C = A$ ]

**thm** *A3*[*of*  $A (B \rightarrow A)$  *A*]

We show that *A1* is redundant

**theorem** *A1Redundant*:

**shows**  $A \rightarrow A$

**proof** –  
  **have** 1:  $(A \rightarrow ((B \rightarrow A) \rightarrow A)) \rightarrow ((A \rightarrow (B \rightarrow A)) \rightarrow (A \rightarrow A))$  **by** (*rule A3*[**where**  $B = (B \rightarrow A)$  **and**  $C = A$ ])  
  **have** 2:  $A \rightarrow ((B \rightarrow A) \rightarrow A)$  **by** (*rule A2*[**where**  $B = B \rightarrow A$ ])  
  **from** 1 2 **have** 3:  $(A \rightarrow (B \rightarrow A)) \rightarrow (A \rightarrow A)$  **by** (*rule ModusPonens*)  
  **have** 4:  $(A \rightarrow (B \rightarrow A))$  **by** (*rule A2*)  
  **from** 3 4 **have** 5:  $A \rightarrow A$  **by** (*rule ModusPonens*)  
  **thus** ?thesis .  
**qed**

**theorem**  
  **shows**  $A \rightarrow A$   
  **by** (*metis (full-types) A2 ModusPonens*) — Sledgehammer even finds a proof without using A3

## 4 Exercise 3

**theorem** *exercise3*:  
  **assumes** 1:  $A \rightarrow B$   
  **assumes** 2:  $B \rightarrow C$   
  **shows**  $A \rightarrow C$   
**proof** –  
  **have** 3:  $((B \rightarrow C) \rightarrow A \rightarrow (B \rightarrow C))$  **by** (*rule A2*[**where**  $A = B \rightarrow C$  **and**  $B = A$ ])  
  **from** 3 2 **have** 4:  $A \rightarrow (B \rightarrow C)$  **by** (*rule ModusPonens*)  
  **have** 5:  $(A \rightarrow (B \rightarrow C)) \rightarrow ((A \rightarrow B) \rightarrow (A \rightarrow C))$  **by** (*rule A3*)  
  **from** 5 4 **have** 6:  $((A \rightarrow B) \rightarrow (A \rightarrow C))$  **by** (*rule ModusPonens*)  
  **from** 6 1 **have**  $A \rightarrow C$  **by** (*rule ModusPonens*)  
  **thus** ?thesis.  
**qed**
